

Aurora Cloud Operations Guide

This guide covers the maintenance window, DR objectives and incident escalation policy for the Aurora Cloud production environment.

Maintenance Window

The default maintenance window is every Wednesday 02:00-04:00 (UTC+8). Planned changes should be scheduled inside this window whenever possible.

DR Objectives

RTO (Recovery Time Objective): 30 minutes. Core services must be restored within 30 minutes after a regional outage.

RPO (Recovery Point Objective): 15 minutes. At most the last 15 minutes of data may be lost. The managed database keeps backups and cross-region replication at a 15-minute granularity.

Incident Escalation

P1 incident: core service unavailable or data safety at risk. The on-call lead MUST respond immediately and escalate to the service owner within 10 minutes.

P2 incident: partial functionality degraded with a workaround. The on-call lead responds within 15 minutes.
